PLANET AI Launches JAIDE: “Made in Germany” AI Assistant Turns Corporate Knowledge into Actionable Intelligence

Rostock, Germany, November 3, 2025 – PLANET AI is expanding its product portfolio with JAIDE, an AI assistant that makes corporate knowledge intelligently accessible. Unlike generic chatbots, JAIDE is purpose-built to individual business processes and operates with a specialized agent architecture. The solution runs on-premises, in private cloud, or hybrid environments, ensuring complete data sovereignty without reliance on US cloud providers.

From Search to Answers: AI That Understands Processes

“JAIDE is not just another chatbot,” says Jesper Kleinjohann, CEO of PLANET AI GmbH. “Our solution uses specialized AI agents that work together. For example, one agent handles and understands incoming documents, another manages business process logic, and a third connects external tools and domain-specific sources. This orchestration delivers far more accurate results than a single generic model.”

A key innovation in JAIDE is its structured workflows. Instead of forcing users to craft the perfect prompt, JAIDE guides them through pre-built, industry-specific processes. The result: consistently high quality regardless of technical expertise.

The Synergy Effect: JAIDE Built on IDA’s Data Quality

A critical advantage lies in the integration with IDA, PLANET AI’s proven document processing solution. While other AI assistants access flawed OCR output or unstructured PDFs, JAIDE operates on clean, structured data. “This reliability is crucial, especially in regulated industries such as public administration,” Jesper Kleinjohann emphasizes.

Three Core Use Cases in Focus

JAIDE addresses real-world business challenges:

- **AI-powered knowledge management**, e.g. in mechanical engineering: Service technicians locate technical documentation, operating manuals, and maintenance records in seconds. No more digging through filing cabinets or scrolling through endless PDFs.
- **AI-powered tender management** for IT service providers and the public sector: JAIDE analyzes complex tender documents and extracts structured, actionable insights.
- **AI assistant for administrative processes**: Supporting the creation of memos, statements, and official decisions with transparent AI assistance.

Each solution is developed through close co-creation with customers, with AI models fine-tuned on industry-specific expertise to ensure relevance and accuracy.

Made in Germany: Data Sovereignty as Core Promise

JAIDE runs on-premises, in private cloud environments, or in hybrid configurations. “Data sovereignty isn't marketing speak for us—it's how we operate,” Jesper Kleinjohann says. “Our customers maintain complete control over their sensitive data, with zero dependence on US cloud providers.”

The model-agnostic architecture supports integration of various Large Language Models, adapting to customer requirements and deployment scenarios.

With IDA and JAIDE combined, PLANET AI delivers end-to-end intelligent document processing. Together, these solutions transform static data repositories into dynamic business assets.
